Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement 1	Inspired from vision of Shri Prime Minister Narendra Modi to provide every citizens easy access to primary healthcare facilities through Ayushman Bharat Health and Wellness Centres (AB-HWCs) Ministry of Health and Family Welfare. During our field work in 10 villages in different regions of Maharashtra state and different municipal areas of Pune City and the sample date collected this has been clearly observed that population has various non-communicable diseases such hypertension, diabetes, obesity, BP, Joint pain, Spinal cord problem, Acidity, Anxiety, thyroid and women health issues. To address this problem, we started a training program for various individuals and community in different areas across geographical boundaries across nations (ONLINE). This online training program was found flexible, accessible by the individuals and communities because they could to their exercise, following diet and nutrition's at their comfort and flexibility of time. In spite of having the online sessions still the accessibility and flexibility was observed ?
Name of the PI/ Co-PI	Prof. Santosh Darade
Contact Details	**Mobile # 9922919565 , Email ID : santosh.darade@mituniversity.edu.in**
Domain	Healthcare
Technology | Research Area	Cloud Computing & Hybrid Cloud
Summary | Project Objectives	• To create online exercise training platform which is sustainable, affordable and accessible to every individual. • To create train, the trainers program and monitoring support to help the individuals to become physically fit. • To guide and support people having non-communicable diseases such as hypertension, diabetes, obesity, BP, Joint pain, Spinal cord problem, Acidity, Anxiety, thyroid, women health issues though the team of Doctors, Nutritionist and wellness coaches.

Scope of Work:	• Govt of India under the stewardship of Prime Minister Shri Narendra Modi has proposed an emphasised to have wellness centres in every village. • Based on sample data collected it is clear that different strata of society across various age groups need good health through exercise, diet, nutrition and through regular health check-ups. • This will create health individual which ultimately will create heathy nations. • To create platform for MIT Art, Design and Technology University (pilot project) for students and faculties and expand it to large scale once the platform is mature or pilot get successful.
Deliverables **(Expected Outcomes)**	- Web platform and Mobile based application
Core Discipline | **Multi-Disciplinary*** ***(*Refer domains x technology matrix)***	Multi-Disciplinary

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement 2	When people in transit they must connect to their near and dear one and take their help in case of any emergency situations (garage, hospitals, police stations, hotels, petrol pump) and also provide the service on go such as carrying their goods, share ride and accompany them at meeting point. Platform that secure the start and end journey of the rider & his family and provide them run time support/ solution during the transit.
Name of the PI/ Co-PI	Prof. Santosh Darade
Contact Details	**Mobile # 9922919565, Email ID :** santosh.darade@mituniversity.edu.in
Domain	Transport and Mobility
Technology | Research Area	Cloud Computing & Hybrid Cloud
Summary | Project Objectives	• To get the help from close friends/ relatives during emergency/panic situation when we are in transit. • To provide immediate assistance/service with support from close friends, relatives who are on the same route or in predefined proximity. • To provide pick and drop of people in our proximity, goods and services.
Scope of Work:	• During transit when we get stuck into the traffic it will be very panic situation when something went wrong such as accident, mishap, natural disaster, vehicle issues. • Ask for immediate or readily available solution. • Effective & efficient on-time support • Smooth operations during emergency situations
Deliverables **(Expected Outcomes)**	- Web based & Mobile based platform
Core Discipline |	Core Discipline

Multi-Disciplinary* ***(*Refer domains x technology matrix)***	
Source (Literature reference)	Own Idea.

Case scenario based on the problem statement

Case 1 :

Rider will intimate his/ her journey staring point and ending points to all the friends and relatives who are on the same route.

Case 2:

The platform will create a Meeting Points using the Curve based & KNN Based Algorithms. Depending upon the availability and the emergency situation friends and relatives who are on the same route or in predefined proximity will meet at common/ Meeting points.

Case 3 :

Interested to meet or not ?

If interested, then depending upon equal time both can meet at common/ meeting point (Using curve based algorithm the location and the duration required of both the people will be shared to each other).

Here our objective is to create an accurate meeting points to avoid the delay in traveling and to help each other in taking goods & share ride in case required. And also help the rider to reach to the final destination safely and within stipulated time.

Once the meeting point is created the rider can take the goods and share the ride with near and dear one as per the availability of the seats. This will achieve objectives of providing the pick and drop of people in our proximity, goods and services.

If not interested, then simply get a call before 10km along with sms and whats app message. To just say hello and ask for route safety.

Case 4 :

In case of emergency/ panic situation the nearest person on the same route will help the rider and his family in taking them into garage, hospitals, police stations and providing them information about hotels, petrol pumps within proximity.

Case 5 :

The platform will be end to end secure the information about the rider and the people who added from the same route.

Rider can take a call whether his/ her information of the passenger wants to provide or not.

Case 6 :

In case rider's close friends, relatives are not available because of their personal reason. Then rider can get the help from next close friends and relatives of that existing friends which is completely optional or rider's choice and depends upon need.

The validation of the friend's friend only with otp of the rider and existing friends. (Three-way validation).

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement	GPS location based complaint register system about the surrounding civic issues/failures to the local/state/central government.
Name of the CRIEYA Innovation Officer	Mr. Sameer Paranjape, Santosh Darade
Contact Details	M: +91-8888907652 Email: Sameer.Paranjape@mituniversity.edu.in
Domain	Urban/Rural Design (Smart Cities And Sustainable habitat)
Technology | Research Area	ML, AI, Cloud Computing, and Big Data Analytics.
Summary | Project Objectives	: Create a platform for common man to register their complaints to the appropriate local civic body authorities. : To setup a system that utilizes the AI concept to map the complaints with appropriate authority. : Establish a system which trace the complaints location by using GPS w.r.t. longitudes, latitudes, and degrees. : Formulate a fare and reliable grievance and compliance system for complaints and their follow-ups.
Scope of Work:	: Help to people to register their complaints to the appropriate agency/authority. : AI oriented system which will do the all backend work and report to the respective individuals. : Smart change to the era of grievance and compliances. : Encourage the human involvement into the betterment of the society. : Work on longitude and latitude GPS reporting therefore easy to track the actual problems on the ground and easy to show as evidence whenever required. : It will have facility to register the complaints by click of the photo or recording the audio or video with longitude and latitude signatures.

Deliverables **(Expected Outcomes)**	: Application Software with App. : Relational Database with connectivity of all open sources government databases. : Artificial Intelligence system to act as middle man. : Image & audio processing system to clean the input. : GPS API to trace the longitude and Latitude of the user's location for creating the GPS signature to identify the exact Geo location of complaint area.

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement	Automated branding of MIT ADT University events on various Social Media platforms, including capabilities like Analytics, Monitoring, Content Management, Ad Campaign Management, etc.
Name of the CRIEYA Innovation Officer	Prof. Santosh Darade
Contact Details	**Mobile : 9922919565 , Email ID : santosh.darade@mituniversity.edu.in**
Domain	Media and Entertainment
Technology | Research Area	Big Data and Analytics
Summary | Project Objectives	• To Develop Brand Awareness • To Increase Size of Social Communities and Accurately Target Audiences. • To Strengthen Engagement Strategies to Increase students, parents Loyalty. • Convert Social Followers into Qualified Leads and New Business.
Scope of Work:	Automated branding of MIT ADT University events Automation process helps marketers save time and effort spent on managing social platforms, engaging with prospects, and enhancing brand awareness.
Deliverables **(Expected Outcomes)**	• This system allows administration to bypass direct interaction on a social media platform and automatically perform a task for us. • This way, we can do more on social media in less time, without sacrificing much in terms of authenticity and responsiveness.

Project #	CRIeSP – 2022 - …. (D) - …. (T) - ….
Title of Problem Statement **CSE-IT/ 2023/4**	We observe many Static posters across different locations of MIT ADT University for different events, programs, workshops. The main problem with the static content and design is fixed and once its printed we don't have any option apart from reprinting and replacement with new copy. Replace the old posters which are on different heights and it can also be dangerous to replace that poster and attach a new one in that place. I want to address this problem by making this prototype project using IoT based smart display screen like AdonMO and AWS services which will replace this advertisement notice type of board with IoT based digital smart AI power billboards and display across different locations into campus, buses, canteens etc.
Name of the PI/ Co-PI	Prof. Santosh Darade,
Contact Details	**Mobile # 9922919565 , Email ID : santosh.darade@mituniversity.edu.in**
Domain	Education, Media and Entertainment
Technology | Research Area	IoT
Summary | Project Objectives	• To build IoT based Digital AI power Billboards which will replace all that static poster with dynamic, advertisement with smart display screens. • To develop a creative posters using AI from the existing contents and display through IoT based screens across different locations. • To complete the pilot project for MIT ADT University and its successful demonstrations by displaying posters across different locations.
Scope of Work:	Replace those static posters with a dynamic digital poster creates the immediate impact. Images come to life and videos attract. People are drawn to look at the content on show and are influenced by this dynamic information. It is well known today that retailers for example, see uplift in sales following digital signage installations when displays are placed in prominent places combined with eye catching targeted material. Digital signage puts your advertising campaigns firmly in the present. Centrally managed, the system user is in full control and content can be update regularly, scheduled for different

	promotions or offers, giving flexibility to the venue owner and staff.
Deliverables **(Expected Outcomes)**	IoT based device with its integrated software application
Core Discipline | **Multi-Disciplinary*** ***(*Refer domains x technology matrix)***	Multidisciplinary

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement	Cloud based Cloth management system for effective Reuse, Recycle and Repeat of costly cloths (Blazers, SAREES, Salwar, and three Pieces) purchased during the Marriage or Festivals.
Name of the CRIEYA Innovation Officer	Prof. Santosh Darade
Contact Details	**Mobile : 9922919565 , Email ID : santosh.darade@mituniversity.edu.in**
Domain	Urban/Rural Design (Smart Cities &Sustainable Habitat)
Technology | Research Area	Artificial Intelligence & Machine Learning
Summary | Project Objectives	According to the Indian Textile Journal, it is estimated that more than 1 million tons of textiles are thrown away every year, with most of this coming from household sources. Less than 1% of the fibre is reused to make new clothes, representing the loss of the billions of dollars' worth of clothes, which are not reused and thrown as waste, adversely affecting the environment, according to the foundation. There should be certain mechanism which will helps buyers to get all those quality cloths buy during the Marriage, Festivals &to reuse, recycle them. Objective of this project is : • To develop a system which will effectively provide good quality cloths from providers with their cost/ benefits/offerings/ services • To create supply management chain that will helps seller & buyer to get the required cloths at their doorstep.
Scope of Work:	Today, the textile industry is one of the most polluting industries in the world and in India; it is the third-largest source of waste after plastic, paper and compost. Large textile hubs in the country can produce up to 45,000 meters of fabric waste on a daily basis. We are trying to develop a system that uses the Artificial Intelligence & machine learning algorithms to effectively find the match as per the customer requirements.
Deliverables (Expected Outcomes)	Cloth management system
Core Discipline | Multi-Disciplinary* ***(*Refer domains x technology matrix)***	Multidisciplinary (CSE/ IT, Management, Design)

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement **CSE-IT/ 2023/3**	Protecting human habitation and crops from wild animal intrusion and attacks. This automated system detects the intrusion of wild animals and repels them back without causing any harm. The specified operations are performed with the touch of a deep learning technique called MobileNet SSD. Once the wild animal is detected an alarm sound is produced to drive away them back. Along with, an alert message is passed to responsible authorities to make awareness of the detection. Hence minimizing the dangerous consequences caused by the conflict and can be considered as advancement in the smart agricultural applications.
Name of the PI/ Co-PI	Prof. Santosh Darade,
Contact Details	**Mobile # 9922919565** **Email ID : santosh.darade@mituniversity.edu.in**
Domain	Agriculture and Food Technology
Technology | Research Area	IoT , Machine learning
Summary | Project Objectives	The system mainly focuses in providing an automated wild animal detection and repellent system, for human habitat and crop fields. The whole system flow can be divided into three major objectives . 1. To develop an automated intelligent wild animal-intrusion detection and repulsion system that can repel them back to their habitat without any harm or threat. 2. To Build Animal Detection model which works on real time video streaming. 3. To build a relevant impact on the agricultural sector by preventing animal attacks on crops without harming them.

Scope of Work:	Humans and Wildlife have become increasingly conflicting about living space and food, causing personal injury, loss of income from crop attacks and predation by livestock, and even loss of life. Wildlife can be killed in defense and retaliation, and support for protection can be diminished. Human-wildlife conflict is a global issue. Finding a safe way to live with the wildlife is important. Hence to avoid hampering both the safeties the proposed architecture promises a new platform to ensure the conservation of trespassed wild animals and also the human settlements.
Deliverables **(Expected Outcomes)**	IoT based device with its integrated software application
Core Discipline | Multi-Disciplinary* ***(*Refer domains x technology matrix)***	Multidisciplinary
Source (Literature reference)	Self and based on inputs from farmers.

Project #	**CRIeSP – 2022 - …. (D) - …. (T) - ….**
Title of Problem Statement **CSE-IT/ 2023/6**	Everyone faces the problem of choosing best suitable cloud service and cloud service provider when they want to deploy their project/product on cloud, although it's a simple but a common problem, people get confused when it comes to choose between which cloud service to take in terms of power, capacity, storage or pricing. We need to Develop a system for Migrating backups across providers (cloud etc), so that customer can choose the cheapest option for their backups.
Name of the CRIEYA Innovation Officer	Prof. Santosh Darade
Contact Details	**Mobile : 9922919565 ,Email ID : santosh.darade@mituniversity.edu.in**
Domain	Education
Technology | Research Area	Cloud Computing
Summary | Project Objectives	Objective of this project is • To provide list of cloud service providers with their cost/ benefits/offerings/ services • To provide the analysis report on the basis of track record of the service provider to the customer. • To develop a system for migrating backups across providers to help customer to choose cheapest option.
Scope of Work:	Step 1. Planning migration • Need to Verify that the hosting platform on the source server is supported for migration: List of supported panels for migration. Step 2. Migration pre-check • Server Management > Extensions > Migrator > Start New Migration. Step 3. Migration post-check • After migration is finished migrator provides output with migration results for each subscription
Deliverables **(Expected Outcomes)**	• Netapp should provide the list of service provider with their cost & features.
